

Still Can't Find the Leak?

If you still have not identified the leak, try systematically shutting off water to areas of your home and rechecking the meter. When the numbers stop increasing, you have found the area of your leak, possibly in the piping. You may have to call a professional to solve the problem.

Repairs

Replacement Parts

If you find a leak and the repairs require new parts, remember to take the worn parts with you to the hardware store to ensure that you find a correct match.

Avoid Scratching

You can prevent scratches on metal surfaces such as showerheads or faucets by covering your pliers or wrench with masking tape.

Top 5 ways to save water at home

1. Replace your old bathroom fixtures to more efficient models.
2. Regularly check your home for leaks.
3. Replace your old washing machine for a high efficiency model.
4. Let your lawn go golden and be water wise outside.
5. Never run a dishwasher without a full load

Summer drought is the 'new normal'. So is managing our water supply better. This brochure series offers tips and tools to make 'living to the new normal' easier.

Identifying Leaks

newnormalcowichan.ca

Do I have a leak?

Identifying and fixing leaks is easy and will save you money.

While it may seem like leaks are insignificant, those small drops can lead to a lot of wasted water. A leaking toilet can waste over 19 litres per minute while a leaking faucet can use between 280 to 750 litres per week.

Most leaks can be easily repaired with household tools and replacement parts are available in most hardware stores.

Check your meter

The easiest way to identify leaks is to read your meter. Before you go to bed, write down the number on your meter. When you wake up, before you use any water, read the number again. If the number has changed — you have a leak.

Find your meter

Your water meter is located near the curb of your property, possibly under a plastic lid. If your water meter is locked, contact your local water supplier or municipality for assistance.

Finding Leaks

AN APPLIANCE SEARCH

Toilet

The most common cause of unidentified leaks in the home is the toilet. Often silent, leaking toilets can waste a huge amount of water every month. To check if your toilet is leaking, add some food colouring (or pick up a toilet dye puck from your local government office or hardware store) and wait ten minutes.

Faucet

Worn O-rings and washers often cause faucets to leak or drip. While it seems insignificant, one drip per second can fill

Irrigation System

If you have an underground irrigation system, check if it is leaking. Walk around irrigated areas; if a patch is constantly wet, you may have a leaking pipe. Reading your meter is also a great way to see how much water your irrigation system actually uses. Check the meter, turn on your irrigation system, and then check the number when it is finished. Subtract the second number from the first to find how many cubic meters of water per minute your irrigation system is actually using.

Showerheads

Leaking showerheads are also easy to spot visually. In some cases the leak will only be noticeable during the shower when some sprays are misdirected. This is wasting water and can easily be fixed by cleaning out the showerhead.

Ice Maker

If you cannot find a leak and the change in your meter is very low, your automated ice maker could be using the water. Some ice makers turn on at night. This is not a leak.

Fixing leaky toilets is easy.
